Preface

The Oesterreichische Nationalbank first launched surveys on direct investment in the early 1970s. Initially the surveys focused on highlighting nonresidents' influence on the Austrian economy, but very soon the Bank started surveying Austrian direct investment abroad, too. As the economic importance of direct investment grew over time, survey intervals were changed from a biennial to an annual frequency in 1989. A threshold of ATS 1 million (EUR 72,000) also introduced in 1989, has been instrumental in keeping the burden for respondents and compilers low. The structure of the questionnaire has remained broadly unchanged from 1993 until this year, but will be

adapted for next year. Economic developments, new international reporting requirements and the constant strive to reduce the reporting burden have made it necessary to redesign the questionnaire, as a result of which the report will also be restructured. Consequently, next year's publication will be different. Bearing in mind user requirements we will nevertheless try to provide as many time series as possible without breaks. Feedback from users is welcome and will be taken into consideration wherever possible.

This publication, as well as additional information on this topic, is available at www.oenb.at/en/stat_melders/statistics_and_reporting.jsp.

1 Results of the 2005 Survey and Development of Selected Indicators

1.1 Review of 2005 Results and Outlook for 2006

According to the results of the OeNB's latest survey of Austrian direct investment abroad and foreign direct investment (FDI) in Austria, outward FDI totaled EUR 55.5 billion at the turn of 2005/2006, which represents an increase by roughly 11.5 % over a year. This means that Austria's degree of outward internationalization continued to grow considerably during the reporting year. Growth in terms of value was mainly driven by investment in equity. While financing through loans from parent companies contracted slightly by EUR 160 million, equity soared by EUR 5.6 billion. Half of this increase reflects a rise of voting capital (EUR 3.5 billion). Good results allowed companies to reinvest substantial sums, leading to an increase of both reserves (+EUR 1.5 billion) and annual profits (+EUR 930 million). The net balance of profits and losses brought forward went down by EUR 350 million to EUR 4.1 billion. For the first time, the number of Austrian affiliates abroad covered in the survey exceeded the threshold of 3,000 (3,013), which corresponds to a growth rate of 10.5%. As the number of reporting Austrian investors picked up only marginally (from 1,006 to 1,048) one may draw the conclusion that experienced investors extending their operating range dominated the scene in 2005. The number of employees in affiliated enterprises abroad rose by 16.5%, which is even stronger than the year before, leading to a total of 437,700 persons.

Inward FDI stocks, i.e. the assets of resident enterprises partly or wholly owned by foreign investors, exceeded all expectations with a

growth rate of 28.6%. In absolute terms the increase amounts to EUR 13 billion, which adds up to a total of EUR 58.9 billion (book value) at the end of 2005. The increase can partly be explained by valuation gains following the restructuring of enterprise groups, partly it was caused by investors expanding the assets of existing affiliates, while little money was used in 2005 to actually buy Austrian firms or last of all to invest in new production facilities. This development is reflected in the fact that balance sheet reserves grew by as much as EUR 9.7 billion, while nominal capital went up by only EUR 200 million. Net profits rose by EUR 2.5 billion and net profits brought forward by EUR 1.5 billion. At the same time, the number of investors grew by a mere 0.9%, and the number of affiliated enterprises by only 2.1%. The number of Austrians working for foreign affiliates even decreased visibly – by 12,100 to 220,700 employees.

Contrary to initial estimates for 2005 published in 2006, the survey results show inward FDI stocks to have slightly outweighed outward stocks. Austria's positive FDI balance, first observed in 2003 and reinforced in 2004, has thus been newly reversed. Unfortunately, the growing dynamics and complexity of international mergers and acquisitions, restructurings and related revaluations make such forecasts more and more difficult. The projections for 2006 in table 1 must be seen against this background.

Said projections for 2006, based on the currently available balance of payments data, would imply the return to a close to balance result (see table 1). Yet because of the expected

¹ E.g. exchange rate changes differences between book value and market value, differences in coverage.

changes in methodologies of measuring direct investment (valuation at market prices for listed companies, extension of the notion of “other capital” in direct investment and the exclusion of “special purpose entities”; see section 1.6) a simple extrapolation would be misleading.

With Austria continuing to actively pursue internationalization, its “direct investment gap” will continue to shrink after the setback in 2005.

UNCTAD’s World Investment Report provides time series on FDI stocks for almost all countries in the world in USD and in relation to GDP. According to UNCTAD’s World Investment Report 2006¹ worldwide FDI stocks rose from close to 8.5% in 1990 to more than 23%² of GDP in 2005. The OeNB’s statistics for 1990 show outward stocks of 2.8% and inward stocks of 6.4%; fifteen years later the respective figures are almost

¹ UNCTAD. *World Investment Report 2006: FDI from Developing and Transition Economies: Implications for Development*.

² In theory, global outward investment should equal global inward investment. Given the practical difficulties of compiling and valuating data and the data gaps in many developing countries that need to be bridged with estimates, the gaps between outward and inward ratios are in fact fairly small. Yet differences may be bigger at the tail end of the series. The actual ratios for 2005 are 23.9% for outward investment and 22.7% for inward investment.

balanced at 22.5% and 23.9%. This development is even more impressive when one takes into account that in the early 1980s inward stocks had still exceeded outward stocks by a ratio of 5:1.

1.2 Regional Breakdown

Austria once more confirmed its “traditional” role as an important investor in the transition countries of Central, Eastern and Southeastern Europe in 2005. In terms of number of investments, growth was strongest in the Czech Republic (+33), in Romania (+27) and in Germany (+25). In terms of money the biggest increase between January 1 and December 31, 2005, was observed in Romania (+EUR 1.3 billion) and Croatia (+EUR 940 million), the Netherlands (+EUR 940 million) and Switzerland (+EUR 930 million); see also table 2.1 in section 3). The United Kingdom (+EUR 780 million) and a number of New Member States of the EU ranked next (Czech Republic: + EUR 770 million, Bulgaria: +EUR 730 million, Poland: +EUR 660 million and Slovenia: +EUR 420 million). Growth in terms of employment was strongest by a clear margin in the Ukraine (+16,600 employees under Austrian influence), followed by the Czech Republic, Germany and Spain, which each posted an increase of more than 5,000 employees.

The most prominent individual investment deals in 2005 were the acquisition of the Ukrainian Bank Aval by Raiffeisen, Mobilkom Austria and EVN entering the Bulgarian market, and the purchase of shares of Oerlikon Corporation (Switzerland) by Victory Industriebeteiligung AG. Significant disinvestments were reported for Caribbean offshore centers, where a number of multinational companies

with holdings in Austria have liquidated assets worth several billions of euros. This was the main reason why the OeNB’s survey showed a decline of EUR 2.2 billion for investment *outside* Europe, while the number of investments and the number of employees outside Europe went up by approximately 10%.

At the beginning of 2006 the transformation countries of Central, Eastern and Southeastern Europe (including the new EU members) “hosted” 44% of Austrian direct investment capital abroad (compared to 38% a year before). At the same time this area accounted for around 50% of individual investments and 70% of employment in affiliated enterprises.

As in the past, *inward* FDI focused on Germany and the EU countries (see table 2.2 in section 3). Between the end of 2004 and end-2005 the biggest increase in inward FDI stocks was observed – one might say “as expected” – for German investors (+EUR 5.2 billion or 38% of the total increase). Other leading investor countries, like the U.S.A., the Netherlands and Switzerland raised their shareholdings in Austrian enterprises by billions (+EUR 2.0, EUR 2.3 and EUR 1.2 billion respectively). The United Kingdom, typically a major investor, withdrew funds worth EUR 330 million. It was replaced by South African investors who channelled more than EUR 1.5 billions into resident enterprises.

At the end of 2005, German investors accounted for 38% of inward FDI. Another 32% were in the hands of investors from other (old) EU countries. Investments from the “new” member countries, in contrast, while steadily growing in numbers, do not yet add up to substantial figures in terms of value. The rest of

Europe (especially Switzerland and Liechtenstein) was the source of another 9% of inward FDI. The U.S.A, with a share of 12%, was the most important non-European investor followed by South Africa with 4%, while Japanese or Arab investors hold less than 2% each.

1.3 Sectoral Breakdown

More and more often Austrian investors use holding companies for investment abroad, which is reflected in an increase of investment in “real estate and business activities” (Sector K of NACE 2003, which also encompasses management holding companies) by EUR 2.9 billion (see table 3.1 in section 3). Investment abroad in the trade sector was of almost equal size (+EUR 2.2 billion). Other expanding sectors were “transport and communications,” where stocks almost doubled with an additional EUR 600 million, and the chemicals, rubber and plastic industry, where the value of Austrian affiliates abroad went up by EUR 1.1 billion. There were areas of shrinking investment too, like investment in financial institutions and investment in mining and quarrying (including oil extraction).

If one looks at affiliate employment abroad (table 5.1 in section 3) results seem to be contradictory at first glance. While growing investment in “business activities” and trade is accompanied by corresponding growth in affiliate employment (+10,600 and +14,600), and both investment and employment contracted in mining, employment in the chemical industry declined despite the rise in investment. There is an explanation for this apparent contradiction; most likely it is the result of necessary streamlining when investors take over former state-owned enterprises

with very low productivity. Investment and employment developments diverged also in the financial sector, where money invested declined while employment showed the biggest increase of all sectors (+27,600 or +36%). This reflects the fact that Austrian banks and insurance companies continued to extend their range of activities in 2005 and thus also continued to hire. At the end of 2005 financial affiliates of resident investors abroad employed 104,400 persons – almost as many as the financial sector in Austria itself. The declining financial volumes simply mirror the above-mentioned liquidation of a number of offshore companies registered as “financial holding companies.”

Holding companies dominated the growth of inward FDI stocks in 2005 (not taking into account special purpose entities). Their value expanded by EUR 7.1 billion, which is more than half the total. Other sectors with substantial increases in inward FDI stocks include trade, transport and telecommunications and the food industry.

The decline of employment in resident direct investment enterprises (“foreign affiliates in Austria”) by 5% basically results from a restructuring of the Siemens group, as a result of which manufacturing companies formally owned directly by the German parent were pooled under a resident holding company. Through this restructuring, these companies were moved beyond the scope of the current direct investment survey.

1.4 Income

The total income of nonresident direct investment enterprises (“Austrian affiliates abroad”) soared to a record high in 2005, namely EUR 5.2

Chart 1

Income from Direct Investment

Source: OeNB.

billion (+22%; see chart 1). This strong performance was even topped by resident affiliates of foreign owners, whose income went up by 63%, from EUR 4.1 billion to EUR 6.6 billion. As these income figures are the balance sheet profits for the year, net of reserves built up or liquidated, the amount of profits or losses brought forward is also an important indicator. On the outward side profits carried forward went down slightly from EUR 4.5 billion to EUR 4.1 billion, on the inward side they increased substantially from EUR 5.5 billion to EUR 6.9 billion.

The return on equity of outward direct investment, which had been negative in the early 1990s, reached a record level of 10.8% in 2005. This notwithstanding it continued to fall short of the profitability of foreign affiliates in Austria, which climbed by 2.7 percentage points to 13.8%.³ Once more, foreign direct investment in Central, Eastern and Southeastern

Europe proved especially successful, with the 8 countries from this area that joined the EU in 2004 contributing EUR 2.1 billion and the other 11 countries in the region contributing EUR 1.1 billion to the favorable result. A ranking of profits by countries has Switzerland in the lead, followed by the Czech Republic, Poland, Hungary, Croatia and Romania. Out of 85 countries in which Austrian affiliates are located, only 11 post an overall loss.

To meaningfully compare the earnings power of Austria's inward and outward FDI with other countries, one has to draw on a related, but slightly different indicator, namely total direct investment income, as recorded in the balance of payments, in relation to year-end FDI stocks. The corresponding ratios are smaller because they include "other capital" (with generally low returns on capital; basically intragroup loans) and private real estate (with usually zero

³ The maximum so far was observed in 1995 at 13.9%.

profit). For Austria the 2005 results are 10.1% for outward and 9.4% for inward direct investment. The reference values for the EU-15 are 5.7% (outward FDI) and 5.2% (inward FDI) respectively. While measurement errors limit the international comparability of income (and, to some extent, also of stock figures) the profitability of Austrian direct investment, both inward and outward, is thus very satisfactory.

An analysis at the aggregate level is always heavily influenced by the success of a small number of big enterprises. Therefore it makes sense to provide additional analysis at the corporate level. Micro analysis shows that the median return on equity for outward FDI reached 8.3% in 2005, which is 0.3 percentage points above the record level of 2004. In other words, high profitability is not restricted to big players; a majority of affiliates abroad benefits from a prosperous economic situation. At the same time, micro analysis proves that the big affiliates are indeed especially profitable, because otherwise the arithmetic mean (10.8%) would not exceed the median. Moreover, an analysis of the income distribution shows a parallel shift, i.e. improvements across the board: highly profitable enterprises did even better and loss-making undertakings were able to reduce their losses.

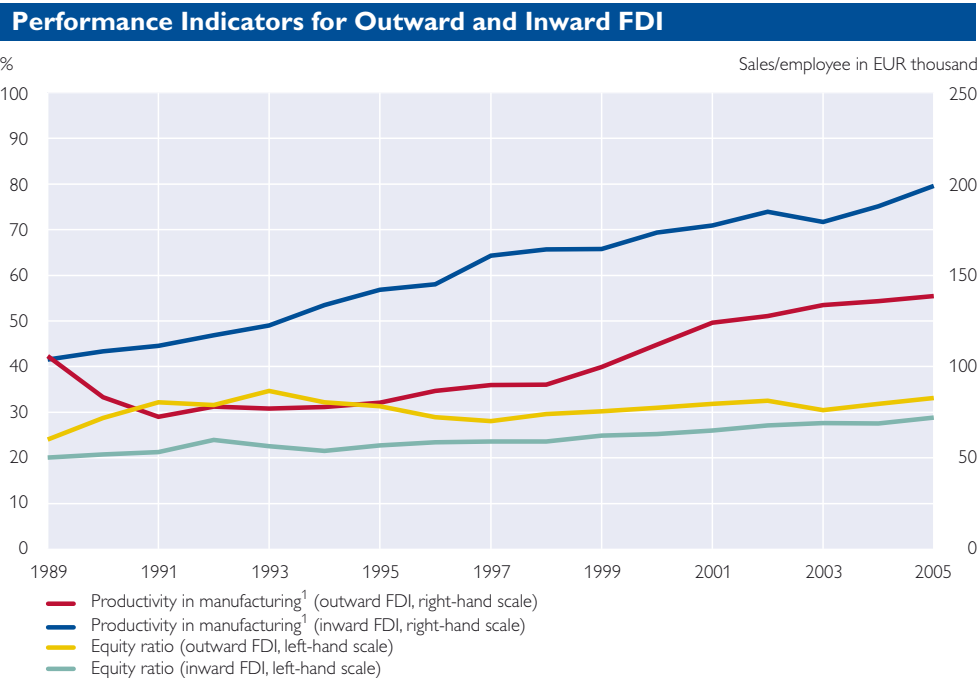

The picture is similar for foreign affiliates in Austria. The median return scored 9.5%, which is 0.7 percentage points higher than in the already successful year 2004. Moreover, the median is also markedly smaller than the arithmetic mean, which implies that the bigger enterprises performed really well. The only difference between inward and outward FDI lies in the changing dis-

tribution of profits. In the case of inward FDI, profitable enterprises were able to improve their situation (the top 10% reported a return on equity of more than 100%), while loss-making enterprises were not able to improve their situation.

Irrespective of the underlying profitability measures and highly visible catching-up processes, outward FDI is still less profitable than inward FDI. The analysis at the corporate level also helps explain this difference. The main reason – as already mentioned in earlier years – is the maturity of the investment projects: The return on equity of an FDI enterprise depends to a large extent on how long the company has been in business. While on the inward side four out of five investments are “old,” which means they have existed for five years or more, this is true only for three out of five outward investments. *Outward* direct investments established for over five years had a return on equity of 10.5% in 2005, significantly higher than that of newer affiliates, which recorded a median of only 3.8%. The same is true of *inward* direct investment: Again, the return on equity for longer-standing investments (11.7%) considerably outpaced that of more recently established investments. The latter’s return on equity reached a median of 0.0%, which means that approximately half of the enterprises posted profits, while the rest posted losses.

The median *equity ratio* (equity/total assets) of both Austrian direct investment enterprises abroad and nonresident direct investment enterprises in Austria has followed an upward trend since the mid-1990s (chart 2). Direct investment abroad produced a median equity ratio of 33% in 2005, a value previously ex-

Chart 2

ceeded only once, in 1993. The equity ratio for inward FDI reached the record high of 28.8% in 2005, but continues to lag outward FDI ratios.

In the manufacturing sector, improved profitability has gone hand in hand with higher *productivity* rates. Before the opening up of Central and Eastern Europe, sales per employee came to somewhat more than EUR 100,000 in both Austrian direct investment enterprises abroad and foreign direct investment enterprises in Austria. The massive flow of funds into Central and Eastern European enterprises, which were usually saddled with old technologies, initially drove down per capita sales in nominal terms to less than EUR 80,000, which must of course be seen in the light of the overall low wage level. However, since 1993 this figure has been rising continuously, and in 2005 it reached EUR 139,000. At the same

time, sales per employee in foreign subsidiaries in Austria came close to EUR 200,000. In the medium term, over a period of ten years, productivity in Austrian affiliates abroad has grown by 5.5% per year, compared to 3.4% p.a. for foreign affiliates in Austria, thus generating a remarkable catching-up process.

The *profits/turnover* ratio in the manufacturing sector amounted to 2.7% for outward FDI and 3.3% for inward FDI. Both results mark a record high, an additional proof of a favorable business climate in 2005.

1.5 Employment

With regard to employment *three* time series deserve special attention (chart 3). Number one is employment at direct investors in Austria, number two employment at Austrian affiliates abroad and number three is employment at foreign affiliates in Austria.

Chart 3

Some enterprises may fall into two categories, such as an Austrian investor that is at the same time a foreign affiliate (regional headquarters located in Austria).

In 2005, Austrian direct investors employed 289,500 persons in Austria (annual average), which corresponds to 9% of total employment in Austria and is 5,800 persons less than in 2004. Broken down by sectors, investors in manufacturing⁴ employed a staff of 137,100, investors in the service sector 152,400.

Considerably more, a total of 431,700 persons were employed by 3,013 Austrian direct investors' affiliates abroad. The number of employees working at Austrian affiliates abroad therefore increased more than tenfold between 1990 and 2005. The majority of these new jobs would not have

been created in Austria, since they served to enter new markets, but the revenues they yield help secure jobs in Austria. If indirectly owned affiliates abroad were included, the figure would rise by another 104,500 or some 25% (see table 18.1 in section 3). The expansion of employment in the services sector (+55,500) by far exceeded the expansion in manufacturing (+5,700). Thus employment in the services sector (223,700 persons working in affiliates of Austrian investors abroad) for the first time surpassed employment in manufacturing (208,000 persons abroad).

The regional breakdown of affiliate employment abroad shows a clear focus of employment in Central, Eastern and Southeastern Europe (304,600 persons or 71% of the total). At the end of 2005, 61,900 em-

⁴ The classification is based on the Austrian Statistical Classification of Economic Activities (ÖNACE). The industries subsumed under manufacturing in this report comprise sections C through F. Services comprise sections G to Q.

employees were based in the Czech Republic, 55,700 in Hungary, 49,200 in Romania, 30,400 in the Slovak Republic, 25,200 in Poland and 20,800 in Ukraine. The former EU-15 accounted for only 82,800 jobs provided by Austrian investors, which is less than a fifth of the total. Outside Europe, Austrian investors are less active, which is reflected in an employment figure of only 34,600 employees. Next to the U.S.A. – with approximately 14,300 employees – came today's boom region, China, where "Austrian-owned enterprises" reported just 3,700 employees.

The second line in chart 3 shows the number of Austrians employed at foreign affiliates in Austria, weighted by the investors' share in equity. Here, a slight downward trend is visible after 1999. In 2005, the number of Austrians employed at foreign affiliates in Austria was 220,700 persons (or 6.8% of total employment) – which is in fact not very different from 1989, when the figure was 224,500. At that time, however, manufacturing was the dominant sector, whereas today the focus of affiliate employment abroad is in services (127,300 employees in services compared to 93,400 in manufacturing). If indirectly owned foreign affiliates in Austria are also taken into account, this figure rises by another 69,900 or 31%.

German investors employed a total of 115,700 Austrians in 2005, which is more than half of affiliate employment in Austria. Swiss investors rank second with 27,200 jobs, followed by the U.S.A with 16,700 employees.

A comparison of Austrian direct investors' headcounts at home and

abroad shows that, for every 100 persons employed in Austria, 149 were on the payroll of affiliates abroad. In other words, those companies that invest abroad are in fact more heavily engaged abroad than in Austria. This is true for industrial enterprises, where the relation is 152:100 as well as for the services sector with 147 workers at foreign affiliates for every 100 employees at the parent company.

The headcounts of Austrian affiliates abroad are less impressive when viewed in terms of the *overall dependent labor force in Austria* rather than just the direct investor's⁵ staff numbers. For every 100 employees in Austria, there are 14 persons working for Austrian affiliates abroad, up from just one person prior to 1990. In other words, one out of eight "Austrian" jobs is in fact located outside the country. Some industries have much higher ratios, though – above all the banking sector with 104,400 persons working at Austrian affiliates abroad. With Austrian financial intermediaries intensively targeting the markets of Central, Eastern and Southeastern Europe, as many as 95 employees of foreign affiliates compare with every 100 employees of financial intermediaries at home. At the same time 13.1% of domestic employment in the financial industry was under foreign influence, which proves that this industry is heavily outbound-oriented (chart 4). The other main industries with a high share of employment in Austrian affiliates abroad are the refined petroleum products, chemicals, rubber and plastic products sector (where 100 domestic employees contrasted

⁵ This is not a "share"; theoretically, the values can rise beyond 100%.

Chart 4

Affiliate Employment Abroad and in Austria as a Share

of Total Employment in Austria

Source: OeNB, Statistics Austria.

with 85 employees abroad), the non-metallic mineral products sector (100 domestic employees versus 67 employees at foreign affiliates) and the electrical and optical equipment sector (100 domestic employees versus 61 persons working for foreign affiliates).

The number of sectors where jobs under foreign control in Austria outweigh resident investors' workplaces abroad has been reduced to a large extent from 1995 to 2005.⁶ Only the

car industry and the machine building industries retain a strong inward bias, with the share of foreign controlled jobs exceeding 25%. A slight inward bias and an altogether small degree of cross-border activities can be found in "hotels and restaurants" and in "transport and communications."

Finally there are several industries with an even balance of affiliate employment in Austria and abroad. Among these industries there are

⁶ Measured as the ratio of persons employed by Austrian subsidiaries abroad (outward FDI) and of persons employed by foreign subsidiaries in Austria (inward FDI) to total domestic employment per sector. The first ratio is theoretically unlimited (upwards), the second is a share which cannot exceed 100%.

some with relevant cross-border links, like trade and business services, while others like agriculture and – not really surprisingly – public services have no cross-border ownership links at all.

1.6 Planned Changes for the Direct Investment Survey 2006

The OeNB's annual direct investment surveys have been broadly unchanged since 1993. While continuity is usually highly appreciated by statistics users, economic developments and changing standards set by international organizations nevertheless call for an adaptation of statistical instruments from time to time. The OeNB launched a completely new data collection system for the balance of payments on January 1, 2007, therefore the reporting year 2006 seems the appropriate time to implement changes in the direct investment statistics, too. The main changes are described in the following paragraphs.

Valuation at Market Prices:

The 5th Balance of Payments Manual issued by the IMF, which guides the compilation of balance of payments statistics worldwide, requires valuation at market price for all cross-border transactions, assets and liabilities. For direct investment, valuation at market price is an easy task for transactions, because the price actually paid – which is the market price – is easily observable. Contrary to this, the market value of an enterprise at a certain point in time is available only for enterprises listed on a stock exchange. Taking account of this fact,

the IMF has accepted book values as a sufficient proxy for unobservable market values. The Austrian FDI time series have thus typically reflected book values. To provide supplementary information, these book values were adjusted on the basis of market value estimates, based on stock exchange information for listed enterprises and on calculations derived from price/earnings ratios for the overwhelming number of unlisted enterprises in the survey.

Based on the EU regulation on balance of payments statistics,⁷ which is applicable from the reporting year 2006 onward, both the ECB and Eurostat require data on FDI stocks to be collected on a mixed basis. Listed enterprises are to be valued at *market prices*, while *own funds* are to be indicated at *book values* for all other units. The effect of this methodological change is shown in columns 3 and 4 of table 2.

The number of listed enterprises covered by the direct investment survey is in fact rather small. On the inward FDI side, where listed enterprises have been recorded since 1994, their number lies between one and two dozens; the first specific search on the outward side, in 2004, yielded less than 10 listed enterprises among the more than 3,000 affiliates abroad. The new methodology results in a higher valuation of FDI stocks, above all inward FDI stocks. This fact is also evident from the OeNB's market value estimates based on price/earnings ratios, the results of which are summarized in columns 5 and 6 of table 2. The stronger revaluation for inward stocks simply reflects their

⁷ The European Parliament and Council Regulation (EC) No 184/2005 of 12 January 2005 on Community statistics concerning balance of payments, international trade in services and foreign direct investment (OJ L 35 08.02.05) is applied.

stronger earnings power during the past years. With the introduction of the new valuation method the OeNB will cease to publish its own estimates of market value.

Special Purpose Entities (SPEs):

Worldwide economic integration and the removal of barriers to capital movements have increased the complexity of transnational enterprises' organizational structure and driven up the number of holding companies without any market activities. According to existing guidelines such "brass plate" companies qualify as both inward and outward direct investment if the shareholdings are across borders. Some multinationals have built up chains of such holding companies, which – in the eye of the critics – leads to double counting or even multiple counting of FDI stocks and flows and, at the same time, conceals the origin and destination of direct investments. While advocates of existing definitions argue that these

chains of ownership are a noteworthy fact by themselves, assessments of production and employment developments are becoming more complicated as such patterns may render FDI statistics meaningless. In order to solve this dilemma, international organizations have come up with the proposal to publish a separate set of satellite statistics which explicitly exclude special purpose entities. Austria will implement this approach starting with the reporting year 2006.

Austria has for a long time been host to many holding companies that are foreign controlled and in turn own subsidiaries abroad – mostly in Central, Eastern and Southeastern Europe. The vast majority of these bridgeheads are active on the local market or at least actively manage their subsidiaries and therefore employ staff. Their importance is indicated in table 25 of the annual report on FDI. Up until 2004 the number of shell companies without specific busi-

ness was very limited and they were of a “reasonable” size, which means that they did not really jeopardize the interpretation of FDI statistics. Unfortunately, in 2005 SPEs of such a magnitude were set up in Austria that it seemed necessary to react. In this publication a handful of companies with a combined business value of EUR 60 billion that have neither employees nor market production facilities are explicitly excluded from the statistics (see table 2). They will be included in reports to Eurostat and the ECB in order to guarantee bilateral symmetry, which is a prerequisite for the compilation of European aggregates, but for users interested in Austrian FDI statistics this “omission” seems appropriate. In the future our statistics will distinguish between “direct investment in a narrow sense,” which excludes SPEs and investment in private real estate (like in this publication) and “direct investment in a broad sense,” as reported for balance of payments statistics and the international investment position.

Other Capital:

Anticipating expected recommendations of international bodies, the interpretation of the concept of “other capital” in direct investment will be extended. While initially only long-term loans between related enterprises were included in direct investment, short-term loans were added to direct investment capital in 1991. As of 2006 all other instruments of intragroup assets and liabilities, like trade credits or clearing accounts, will be subsumed under “other capi-

tal” in direct investment. In addition a currently existing asymmetry in the treatment of intragroup loans is going to be eliminated: *Outward* FDI statistics will cover not only loans granted to immediate affiliates but also loans to other group members. As a result “other capital” in outward direct investment will probably increase by EUR 4.1 billion, while for inward FDI the expected hike will amount to around EUR 3 billion. Taking into account all the envisaged changes the “true” value of direct investment stocks at the end of 2005 would be EUR 65 billion for outward FDI and EUR 73 billion for inward FDI.

Other Changes:

In the process of redesigning FDI statistics the questionnaire has been adjusted as well: Questions concerning changes in voting capital or the distribution of profits and the coverage of losses were eliminated. In turn basic elements of the profit and loss account of the affiliate enterprise were taken on board. Furthermore, direct investors will have to report only *majority shareholdings* rather than *all indirect minority holdings (>10%)*. However, employment and turnover reports for majority holdings will henceforth be compulsory for *all levels of indirect ownership* in order to fulfil the requirements of a European regulation on foreign affiliates statistics⁸ recently adopted by the European Parliament. Given these extensive adjustments, the publication of the OeNB’s special issue on “Direct Investment 2006” may well be delayed.

⁸ Regulation (716/2007) of the European Parliament and of the Council on Community statistics on the structure and activity of foreign affiliates.

2 Method, Definitions and Sources

2.1 Introduction

The following special report presents the results of the OeNB's survey on Austrian direct investment abroad and foreign direct investment in Austria at end-2005. The two surveys provide comprehensive information complementing more recent balance of payments data. While the balance of payments figures are derived from payment flows over a specific period, this survey of direct investment is based on stocks, i.e. enterprises' annual accounts. Data for more than 5,700 enterprises received from 3,500 respondents were evaluated for the 2005 survey.

2.2 Definitions

The Austrian definition of foreign direct investment (FDI) is essentially in line with the concept used by international organizations.⁹ Accordingly, Austrian direct investment abroad – outward direct investment – is understood to mean residents' capital investment abroad made for the purpose of establishing and maintaining a long-term economic relationship with a foreign enterprise with the added intention of exercising a significant degree of influence on its management. This feature distinguishes direct investment from other types of long-term capital investment such as portfolio investment, where the primary objective is profit. Purchase and sale of real estate are part of foreign direct investment according to these definitions. This type of cross-border transactions is actually covered by the balance of payments and accordingly stocks are shown in

the International Investment Position. Since this report is based on a survey of *enterprises*, real estate is not included here.

Basically, there are three different types of direct investment:

- investment in existing or newly established enterprises in the form of cash contributions, setoffs of claims, non-cash capital contributions or the transfer of rights;
- reinvestment of profits, i.e. retention rather than disbursement of at least a portion of the profit earned by the direct investment enterprise. (Such reinvestment can boost capital resources in a number of ways: It can be used to increase nominal capital, it may alternatively or additionally be appropriated to reserves; and finally, it may be booked as profit brought forward.);
- loans and other allocations to enterprises by foreign investors to reinforce these companies' resources (in addition to investors' participation);

The distinction between "equity capital," and "other capital" commonly used in international statistics is drawn on the basis of the above differentiation of direct investment capital.

International organizations (IMF, OECD) call for the collection of market values for surveys. As in almost all other countries, however, the OeNB's surveys are based on book values. The market values given in this publication are stock exchange prices or, failing that, estimates based on a model to determine the capital-

⁹ See IMF (1993): *Balance of Payments Manual, fifth edition*; OECD (1996): *Detailed Benchmark Definition of Foreign Direct Investment, third edition*.

ized value of potential earnings. Following a request by the ECB, the OeNB will switch to a new concept of market valuation starting from the reporting year 2006. This proposal asks for adding market capitalization for enterprises listed on stock exchanges and book values for unlisted companies.

The survey conducted by the Oesterreichische Nationalbank covers only enterprises in which the direct investor holds an investment of at least 10%. Moreover, the investor must hold at least EUR 72,000 (ATS 1 million) of nominal capital. As of the reporting year 2006 this threshold will be raised to EUR 100,000. Other forms of internationalization (e.g. cooperation and consultation agreements) are not included.

2.3 Treatment of “Special Purpose Entities”

Worldwide economic integration and the removal of barriers to capital movements have put question marks to foreign direct investment statistics in a number of countries, notably Luxemburg and the Netherlands. One important reason for growing “distortions,” as some critics call them, are holding companies which are fully owned by foreigners and which have no or only a few employees and no domestic activity apart from holding significant assets abroad. According to existing guidelines, such “brass plate” companies are counted as inward and outward direct investments at the same time. Some multinationals have built up chains of such holding companies,

which – according to critics – leads to double counting or even multiple counting of FDI stocks and flows, and at the same time conceals origin and destination of direct investments. Those in favor of existing definitions argue that these chains of ownership are interesting in themselves, while economists who focus on production and employment sometimes say that FDI statistics are becoming meaningless. In order to solve this dilemma, international organizations have come up with the proposal to publish a separate set of satellite statistics, which explicitly exclude “Special Purpose Entities.” Unfortunately there is no harmonized, commonly agreed definition or treatment of these SPEs¹⁰ at this point.

Austria has for a long time been host to many holding companies, which are foreign controlled and in turn own subsidiaries abroad – mostly in Central, Eastern and Southeastern Europe. The vast majority of these bridgeheads are active on the local market or at least actively manage their subsidiaries and therefore employ staff. Until recently, only a limited number of “passing through” entities were of significant size and therefore never really jeopardized the interpretation of FDI statistics, although some shifts in the regional or activity distribution were known to occur owing to simple bookkeeping measures. Unfortunately, in 2005 major SPEs were set up in Austria, which made it seem necessary to react. In this publication a handful of companies, which represent a value of EUR 60 billion, but have neither

¹⁰ SPEs also include financial institutions which are set up by multinationals only to operate on foreign financial markets. In the case of such institutions, simply taking a loan or issuing a security turns into a negative direct investment (intra-group loan granted from the investee to the investor).

employees nor market production, are explicitly excluded from the statistics. They will be included in reports to Eurostat and the ECB in order to guarantee bilateral symmetry, which is a prerequisite to the compilation of European aggregates; for users interested in Austrian FDI statistics this omission seems to be an advantage.

2.4 Adjustment of Inward Direct Investment Data for the Location of the Parent Company

When statistics on nominal capital are compiled based on the country of origin (frequently called “first-shot” or “immediate owner” concept), the problem arises that the actual decision-maker is not always identical with the direct investor. Consider, for example, a German company acquiring a stake in an Austrian enterprise via a holding company located in Switzerland. To take account of this distortion, i.e. to identify the country of origin of the indirect investor (in other words, the location of the parent company), additional information has been collected since 1982. This information is used to re-assign the capital from the location of the direct investor’s registered office to that of the indirect investor (frequently cited as “ultimate beneficiary owner concept” or UBO). International organizations have proposed to other compilers to adopt the Austrian approach toward dealing with this problem, if they wish to publish “satellite statistics” on direct investment, excluding SPEs.

2.5 Structure of Tables

This publication represents the results of two OeNB surveys on outward and inward FDI. The paired tables of in-

ward and outward direct investment were given an identical structure wherever the data allowed for such a presentation. Thus it is possible to directly compare data on specific aspects of Austrian direct investment abroad (outward FDI) with their counterpart, nonresident direct investment in Austria (inward FDI).

In line with international standards applied to statistics on direct investment, the breakdown by economic sectors is always based on the sectoral structure of the *host* country, i.e. the country of destination. The Austrian survey is based on the new Austrian Statistical Classification of Economic Activities of 2003, which is ultimately derived from the United Nations’ “International Standard Industrial Classification of All Economic Activities.”

The comparison of outward and inward direct investment is complemented by a presentation of the degree of overlap of outward and inward direct investment (Table 25). This table indicates the extent of Austrian outward direct investment by enterprises in which nonresidents hold investments. Important concepts are defined under 2.6 (Glossary).

2.6 Glossary

Direct investment enterprise:

An enterprise in which one or more direct investors hold(s) a stake. The direct investor (an individual or an associated group of individuals or enterprises) must own at least 10% of the nominal capital of the direct investment enterprise. The 10% share must be equivalent to at least EUR 72,000 (ATS 1 million).

Direct investor:

One or more individuals or legal entities owning a share of a direct invest-

ment enterprise in an economy other than that in which the direct investor is domiciled.

Employees:

Unless otherwise stated, the number of employees of a direct investment enterprise is weighted, i.e. multiplied by the direct investor's percentage ownership of the enterprise's nominal capital.

Direct investment:

The relationship between the direct investor and the direct investment enterprise. The number of direct investments is generally higher than the number of investors and of direct investment enterprises.

Net income:

Profit or loss for the year adjusted for profit or loss brought forward.

Direct investment credits:

A distinction between short-term (up to and including 1 year) and long-term credit is made. There is a minor difference between asset and liability side credit data: Whereas on the asset side only data on credits extended by the direct investor (the parent company) to their direct investment enterprises (subsidiaries, associate companies or branches) are collected, the data on the liability side apply to both channels of credit relations between the direct investor (parent or group) and the direct investment enterprise. According to international standards, the statistics include only those short- and long-term direct investment relations *between banks* which are associated with an equity investment or subordinated equity.

In the reporting year 2006 the notion of "other capital" in direct investment will be extended to in-

clude trade credits and other forms of intragroup claims and liabilities. The above-mentioned asymmetry between inward and outward direct investment is thus going to be eliminated.

Equity:

Equity is generally determined using the liability side of the affiliate enterprise's balance sheet (and not e.g. the asset side of the parent company). This approach is called "own funds at book value" and has to be used whenever market capitalization is not available from a stock exchange. Equity is the sum total of nominal capital, reserves and profit or loss brought forward. Following a request by the ECB, the profit or loss for the current year is added to equity.

Total value:

Equity plus the net credit position, i.e. the balance of credit claims minus credit liabilities vis-à-vis direct affiliates (for outward DI) or all intragroup credit liabilities minus credit claims (for inward DI) (see also direct investment credit).

Indirect investments:

Ownership interests that a direct investment enterprise (first-tier affiliate) holds in another enterprise (second-tier affiliate). Unless otherwise stated, nominal capital and employment in second-tier affiliates are weighted twice, once by the nominal capital share held by the parent company in the first-tier affiliate and then again by the latter's share in the second-tier affiliate. For example: A Swiss company owns 60% of the Austrian company X, which in turn owns 70% of the Austrian company Y. Thus, the Swiss company owns 60% of company X and 42% of company Y

(70% multiplied by 60%). Note: Under outward investment, the OeNB's survey covers all indirect investment abroad, but under inward investment it covers only indirect investment in Austrian companies.

Profit or loss for the year:

Profit or loss for the year excluding profit or loss brought forward.

Market value:

By definition, this is the amount a buyer would be willing to pay and a seller willing to accept. In the case of stock companies listed on the stock exchange, market value is the capitalized value of stocks. For most companies, a model to determine the capitalized value of potential earnings must be applied to determine specific approximate "market values." In essence, this valuation is based on the annual income situation during the four preceding years.

Nominal capital:

Capital (book value): If the enterprise is a limited liability company (GmbH), nominal capital refers to the company capital or equity; if it is a joint stock company, it means the face value of the stock (and not the generally higher value quoted).

Breakdown by regions:

Euro area: Belgium, Germany, Greece, Spain, France (incl. Monaco and overseas departments), Ireland, Italy (excl. San Marino, Vatican), Luxembourg, Netherlands, Portugal, Finland.

EU-15: Euro area + Denmark, Sweden, United Kingdom (excl. Guernsey, Jersey, Isle of Man).

EU-25: EU-15 + CEEC-5 + Estonia, Latvia, Lithuania, Malta and Cyprus.

Europe: including European countries of the CIS.

CEEC-5: Poland, Slovak Republic, Slovenia, Czech Republic, Hungary.

CEEC-19: CEEC-5 + Albania, Bosnia and Herzegovina, Bulgaria, Serbia and Montenegro, Estonia, Croatia, Latvia, Lithuania, Republic of Moldova, Macedonia, Romania, Russia, Ukraine, Belarus.

OECD: EU-15 + OECD overseas countries + Iceland, Norway, Poland, Switzerland, Slovak Republic, Czech Republic, Turkey, Hungary.

OECD overseas countries: Australia, Japan, Canada, Mexico, New Zealand, Republic of Korea, U.S.A. (incl. Puerto Rico)

Reserves:

This includes only capital reserves and profit reserves (i.e. taxed reserves in accordance with the Austrian "Rechnungslegungsgesetz" or Financial Reporting Act, which specifies the preparation and presentation of annual financial statements). Accruals (such as provisions for severance pay) are not included, nor is insurance companies' premium reserve stock.

Special purpose entity:

In international discourse, this term is used to denote loosely defined entities within group structures which cause problems in direct investment statistics. This special report defines special purpose entities as holding companies with a negligible number of employees and without market

output which are fully foreign owned and whose assets are primarily composed of foreign subsidiaries and other affiliated companies.

Breakdown by economic sectors:

Direct investment enterprises (or direct investors) are classified by eco-

nomical sector in line with the definitions in the Austrian Statistical Classification of Economic Activities established by Statistics Austria (ÖNACE).¹¹ The breakdown to the third hierarchical level is provided on the following page.

¹¹ *Statistics Austria. 2003. Austrian Statistical Classification of Economic Activities – ÖNACE 2003.*

Activity Classification Based on the Divisions of the Austrian Statistical Classification of Economic Activities (ÖNACE)

Activity	Divisions according to ÖNACE 2003

¹ Affiliates are allocated to the home country of the largest foreign direct investor.

² Total number of employees of direct investment enterprises with a foreign share of more than 50%.

³ Weighted twice: Number of employees of the second-tier affiliate multiplied by the foreign share in the first-tier affiliate multiplied by the latter's share in the second-tier affiliate.

⁴ Total number of employees of the second-tier affiliate if the foreign share in the first-tier affiliate exceeds 50% and the latter's share in the second-tier affiliate exceeds 50%.

⁵ See glossary for definition of regions.
